Dice seed worksheet

> **Filled in, this sheet is your seed phrase: anyone who sees it can take your bitcoin. Never photograph it. Once the words are on metal and checked against it, burn it.**

One die per box: 1, 2 or 3 is a 0; 4, 5 or 6 is a 1. Fill each row left to right. Rows 1 to 23 take 11 bits, row 24 takes 3, for 256 in all. Do not roll for the hatched boxes: they are the checksum from step 3. Number is the sum of the column values above each 1; the GitHub word list numbers its lines from 1, so the line is the number plus 1.
